DECLARATION

We, **(1921260058), Kiruthika (1924260011)** of the Department of

Information Technology, SIMATS Engineering, Saveetha Institute of Medical and Technical Sciences,

Chennai, hereby declare that the Capstone Project Work entitled “**Food Delivery Order Tracking System**” is the result of our own bonafide efforts. To the best of our knowledge, the work presented herein is original, accurate and carried out in accordance with engineering ethics and academic integrity. All sources, references, data, software and other materials used in the project will be appropriately acknowledged.

We further declare that the data, results, analysis and findings presented in this report will not be fabricated, falsified or manipulated. Any external tools, software, datasets, computational resources or AI-assisted tools used in the project will be appropriately disclosed.

Place: Chennai

Date: September 2026

INDIVIDUAL CONTRIBUTION STATEMENT

Student	Responsibilities	Design & Development	Testing & Analysis	Report	%
Dinesh 1921260058	Backend and database support	Order and status modules	Functional testing	Implementation sections	33.3%
Kiruthika 1924260011	Frontend and user interface	Customer tracking screens	UI and integration testing	Testing/analysis	33.3%
Akshaya 1921260087	System design and documentation	Tracking workflow and integration	System-level evaluation	Report coordination/presentation	33.4%
Total	—	—	—	—	100%

ABSTRACT

Food delivery services depend on accurate order processing and timely communication between customers, restaurants and delivery personnel. A common difficulty is that customers may not know the current status of an order after placing it. The Food Delivery Order Tracking System is proposed as a software-based solution that allows users to place or view orders, track order progress and receive clear status information through a centralized application.

The system is designed around an order lifecycle such as Order Placed, Restaurant Accepted, Food Preparing, Ready for Pickup, Picked Up, Out for Delivery and Delivered. The application stores order details and status changes so that customers and authorized staff can view the latest state of an order. A modular design separates user interface, order management, tracking logic and data storage.

The project methodology includes requirement analysis, system design, database modelling, interface development, implementation, functional testing and evaluation. The prototype is intended as an academic system and does not claim production-scale performance, real-world GPS accuracy or commercial payment-security certification. Actual measured performance should be inserted after testing.

Keywords: Food Delivery, Order Tracking, Web Application, Database, Status Management, Real-Time Tracking

CHAPTER 1 INTRODUCTION AND ENGINEERING PROBLEM

1.1 Background

Online food delivery involves several connected activities: customer ordering, restaurant acceptance, food preparation, pickup and delivery. When these stages are not communicated clearly, customers may be uncertain about whether the order has been accepted, prepared or dispatched. A digital tracking system provides a structured way to store and communicate order status.

1.2 Need for the Project

Customers need transparent order information after placing an order. Restaurants need an organized order-status workflow, while delivery personnel need to know which orders are ready for pickup and delivery. A tracking system reduces uncertainty by maintaining a common status record and presenting the latest available state to authorized users.

1.3 Problem Statement

Design and develop a food delivery order tracking system that records customer orders and provides a clear, sequential view of order status from placement to delivery, while maintaining data consistency, usability and role-based access.

1.4 Project Aim

To develop a user-friendly software system for managing and tracking food delivery orders through a centralized order-status workflow.

1.5 Project Objectives

1. To identify requirements of customers, restaurants and delivery staff.
2. To design an order-status workflow and database structure.
3. To develop interfaces for order viewing and tracking.
4. To implement status updates across the order lifecycle.
5. To test core functions, data validation and status transitions.
6. To evaluate system strengths, limitations and future improvements.

1.6 Scope

Included: user/order records, order placement representation, order-status management, tracking interface, database storage, basic role separation and functional testing.

Excluded: production payment processing, certified cybersecurity, live commercial GPS infrastructure, restaurant POS integration and large-scale deployment.

Assumptions: users have access to a supported device and network where required; authorized staff update statuses correctly; database connectivity is available.

Boundary conditions: the academic prototype demonstrates order tracking logic and interface behaviour and should not be treated as a production food-delivery platform.

1.7 Expected Engineering Outcome

The intended outcome is a working software prototype in which an order is stored with a unique identifier and its status progresses through defined stages. The customer can view the latest status, while authorized system users can update the order according to their role.

Engineering Problem Summary

The central engineering challenge is maintaining consistent order state across multiple actors. The design must prevent invalid status transitions, present information clearly, preserve order history where required and remain simple enough for an academic prototype.

CHAPTER 2 LITERATURE REVIEW AND EXISTING SOLUTIONS

2.1 Review Method

The review considers the project requirements and established software concepts relevant to online ordering, transaction workflows, database systems, role-based access and status tracking. Existing approaches are compared according to their suitability for a student-level order tracking prototype.

2.2 Review of Existing Work

Traditional telephone-based ordering provides limited visibility after an order is placed. Basic online ordering systems improve order submission but may provide only a small amount of status information. Modern delivery platforms commonly combine ordering, restaurant processing, courier assignment and customer tracking. Such systems can provide rich real-time information but require complex infrastructure and integrations.

2.3 Comparative Analysis

Existing Approach	Advantages	Limitations	Relevance
Phone/manual ordering	Simple, low infrastructure	Poor status visibility	Baseline
Basic online ordering	Digital order capture	Limited tracking	Relevant
Full delivery platform	Rich tracking and integrations	High complexity/cost	Future-scale reference
Proposed prototype	Clear workflow, simple tracking	Limited production features	Directly relevant

2.4 Research / Engineering Gap

A student project needs to demonstrate the core engineering principle of order tracking without reproducing the infrastructure of a commercial delivery company. The gap addressed by this project is therefore the creation of a focused, understandable prototype that demonstrates order-state management, user visibility and database-backed tracking.

2.5 Proposed Contribution

The proposed system contributes a modular order tracking workflow connecting user interaction, order records, status transitions and tracking display. The architecture can later be extended with maps, live location, notifications, payment integration and analytics.

Literature Review Conclusion

The review supports a database-backed, status-driven architecture as an appropriate foundation. Real-time GPS tracking is treated as an optional extension because it introduces additional hardware, network and privacy requirements beyond the core academic objective.

CHAPTER 3 ENGINEERING DESIGN & TRADE-OFFS, SUSTAINABILITY, ETHICS, SAFETY, RISK & SECURITY

3.1 Requirements

Stakeholder	Requirement
Customer	Place/view order and see current order status
Restaurant	View incoming orders and update preparation status
Delivery staff	View assigned order and update pickup/delivery status
Administrator	Manage users, orders and system records
Type	Measurable Target
Functional	Create and retrieve order records
Functional	Allow valid status updates
Functional	Display latest status to customer
Non-functional	Clear, consistent and responsive interface
Non-functional	Role-based access for protected actions

3.2 Constraints & Applicable Standards

Constraints include limited development time, database reliability, device/browser compatibility, authentication design, data privacy and project budget. The final implementation should follow the security and privacy requirements applicable to the chosen development stack and institutional guidelines. Any production deployment would require additional security assessment.

3.3 Design Specifications

Parameter	Target / Requirement	Unit	Priority
Order ID	Unique identifier for every order	—	High

Status	Defined valid lifecycle stages	—	High
Tracking display	Shows current order state clearly	—	High
Data storage	Persistent order/customer records	—	High
Access control	Protected staff actions	—	High

3.4 Alternative Solutions & Evaluation

Criterion	Simple Static App	Database Web App	Full Real-Time Platform
Performance	Medium	Good	High
Cost	Low	Low–Medium	High
Implementation effort	Low	Medium	Very high
Tracking capability	Limited	Good	Excellent
Scalability	Low	Medium	High

The database-backed web application is selected because it demonstrates meaningful order tracking while remaining feasible for a student capstone.

3.5 Selected Design & Detailed Design

Architecture: User Interface → Application/API Layer → Authentication & Order Logic → Database → Tracking Status Display.

Order flow: Customer places order → Order record created → Restaurant accepts → Food preparing → Ready for pickup → Delivery staff picks up → Out for delivery → Delivered.

The database stores users, restaurants, orders, order items and status information. The application layer validates requests and controls which roles can change particular states. The user interface presents the current status in a simple sequence so that the customer can understand progress.

A normalized database structure reduces duplicate information. A unique order identifier provides a stable reference for retrieval. Status-transition validation is important because an order should not normally move directly from Order Placed to Delivered without the required intermediate actions.

3.6 Trade-off Analysis

Decision	Alternative	Benefit	Disadvantage	Final Decision
Status-based tracking	Live GPS first	Simple and reliable for prototype	No map location	Selected for core project
Database storage	In-memory storage	Persistent records	Requires setup	Selected for realistic workflow
Role-based access	Single-user access	Better control	More implementation effort	Selected

3.7 Sustainability, Ethics, Safety, Risk & Security

Domain	Consideration	Evidence Evaluated	Impact on Decision
Sustainability	Software reduces paper-based status communication	Digital workflow design	Use electronic records where appropriate
Ethics	Avoid misleading delivery estimates	Status/ETA limitations	Show only supported status information
Privacy	Protect customer/order information	Database fields and access roles	Restrict protected records
Security	Prevent unauthorized order changes	Authentication and authorization design	Role-based protected operations

Risk Register

Risk	Likelihood	Severity	Mitigation	Residual
Invalid status transition	Medium	High	Validate allowed transitions	Low
Unauthorized update	Medium	High	Authentication/role checks	Low–Medium
Database failure	Low–Medium	High	Backups and validation	Low–Medium
Incorrect ETA	Medium	Medium	Treat ETA as estimate, not guarantee	Low

CHAPTER 4 IMPLEMENTATION, TESTING & RESULTS, PROJECT MANAGEMENT

4.1 Development Approach & Resources

The project follows an iterative software-development approach: requirements are identified, the system architecture and database are designed, interfaces are developed, order-status logic is implemented, modules are integrated and then tested. Development resources may include a code editor/IDE, browser, database system, version-control repository and local or hosted application environment.

4.2 Software Implementation & Modern Tools Used

Tool / Software	Purpose	Stage Used
Code editor / IDE	Write and manage application code	Development
Web browser	Run and test user interface	Testing
Database system	Store users, orders and status records	Implementation
Version control	Maintain source changes	Development
API/testing tool if used	Test application endpoints	Verification

Implementation modules include user authentication, order management, restaurant/order processing, delivery-status management, customer tracking and database operations. Insert actual screenshots of the completed interface and database here in the final submission.

4.3 Test Plan & Verification

Requirement	Test Method	Acceptance Criterion	Achieved	Status
Create order	Submit valid order data	Order ID generated and saved	Enter result	Pending/Pass
View order	Retrieve order by ID/user	Correct order displayed	Enter result	Pending/Pass
Update status	Perform valid status change	Status saved and shown	Enter result	Pending/Pass
Reject invalid transition	Attempt prohibited change	System blocks update	Enter result	Pending/Pass
Access control	Try protected action as wrong role	Unauthorized action denied	Enter result	Pending/Pass

4.4 Results

No actual test measurements or screenshots were supplied with the source template. Therefore, this report does not fabricate numerical performance values. The team should enter actual pass/fail results, response times and screenshots after testing the completed implementation.

4.5 Data Analysis & Engineering Judgment

Functional results should be analyzed by comparing expected and observed behaviour for each requirement. For response-time measurements, repeated trials can be averaged and the range can be recorded. Failed tests should be investigated through database logs, validation rules, network behaviour and user-interface logic. Engineering judgment should consider correctness, usability, reliability and security rather than only the number of features.

4.6 Comparison with Existing Solutions & Achievement of Objectives

Objective	Evidence	Achievement
Identify requirements	Requirement specification	Fully/Partially – verify
Design database/workflow	Schema and order-state flow	Fully/Partially – verify
Implement tracking	Tracking screen and status logic	Fully/Partially – verify
Test system	Completed test cases	Pending until measured

4.7 Strengths & Limitations

Strengths: clear order lifecycle; centralized records; role-oriented workflow; easy-to-understand tracking display; modular architecture.

Limitations: academic prototype scale; live GPS may not be included; real payment integration may be absent; production security and high-availability requirements are outside scope; delivery time estimates depend on external factors and should not be treated as guarantees.

4.8 Project Planning, Roles & Budget

Item	Estimated Cost	Actual Cost
Development software	Free/open-source where applicable	Enter actual
Hosting/database	Enter actual plan	Enter actual
Domain (if used)	Enter actual	Enter actual
Testing/device resources	Enter actual	Enter actual

CHAPTER 5 CONCLUSION, FUTURE WORK AND REFLECTION

5.1 Conclusion

The Food Delivery Order Tracking System addresses the problem of limited visibility after a food order is placed. The proposed software organizes an order into a defined lifecycle and provides a centralized method for recording and displaying status. The design combines user interaction, database storage, role-based actions and tracking logic. Final claims about performance should be based on the team's completed functional tests.

5.2 Future Work

Future versions can include live GPS tracking, map visualization, push notifications, estimated delivery time calculation, restaurant POS integration, online payments, analytics, scalable cloud deployment and stronger security controls. A production system would also require load testing, privacy review, monitoring, backup and recovery procedures.

5.3 Professional Learning & Individual Reflection

Dinesh: The project develops experience in backend logic, database operations and order processing. The main learning is maintaining consistent records across multiple application actions. Future work would focus on stronger API validation and database optimization.

Kiruthika: The project develops skills in interface design, user interaction and integration testing. The main learning is that a tracking interface must communicate status clearly without confusing users. Future work would improve responsive design and accessibility.

Akshaya: The project develops system-level design, workflow modelling, documentation and presentation skills. A key engineering decision is to use a defined status lifecycle so that the order state remains understandable and consistent. If repeated, more user testing and measured response-time data would be collected before final evaluation.

REFERENCES

Use a consistent recognised referencing style such as IEEE. Include only sources actually consulted by the team.

1. Documentation for the selected programming language/framework, official documentation, accessed September 2026.
2. Documentation for the selected database management system, official documentation, accessed September 2026.
3. Documentation for the selected web/API development tools, official documentation, accessed September 2026.
4. Relevant academic literature consulted on online food ordering, database-backed tracking systems, software engineering and user-interface design.
5. Any datasets, open-source libraries, websites or AI-assisted resources actually used in the implementation should be listed with complete bibliographic details.

APPENDICES

Appendix A – Detailed Design

Insert final architecture diagram, workflow diagram, database schema and screen designs.

Appendix B – Database / Data Dictionary

Insert tables, fields, data types, keys and relationships used in the final system.

Appendix C – Source Code / Repository Information

Insert the approved repository information or essential source-code excerpts.

Appendix D – Screenshots / Implementation Evidence

Insert login, menu, order creation, restaurant status, delivery status and customer tracking screenshots.

Appendix E – Test Evidence

Insert dated test cases, outputs, screenshots and defect/fix records.

Appendix F – User Feedback

Include feedback if collected.

Appendix G – Project Meeting / Progress Records

Include review notes, milestones and progress evidence.

Appendix H – Individual Contribution Evidence

Include task records, code contributions, design files and other evidence supporting the contribution statement.
